

Challenges To Do

(ctd for short)

Challenges

1 - Is it cold in here

find out how to convert celsius to fahrenheit and vise versa to make a calculator that calculates it for the user depending on what format he wants

- check for wrong inputs by user (never trust the user)
- make it accept to modes:
 - mode 1 = celsius to fahrenheit
 - mode 2 = fahrenheit to celsius

example: user input: mode=1, temp=22

```
mode : 1
temp: 22
temp in fahrenheit is 71.6
```

2 - How big can you get

Use loops and lists to get a list of numbers from the user and stop when the user enters a 'q', then print the largest and smallest number in that list wherever it is
example:

```
insert number: 120
insert number: 3
insert number: 22
insert number: 13
insert number: 20
insert number: q
largest number is 120
smallest number is 3
```
